INITIAL PROMPT

“Make me a website for a product/business page of specialty accessories for gadgets.”

REFINEMENT PROMPTS

“Make some of those buttons that doesn't work be responsive.”

“Provide visual photos for the products.”

FINAL REFLECTION:

The Gadget Gear development on Replit demonstrated that automated tools are excellent for rapid component generation and establishing a sleek, tech-focused dark aesthetic, though they often require manual intervention to stabilize complex logic. While the initial React structure and product layouts were built quickly, I had to refine the shopping cart state management, polish the CSS for a professional finish,

and fix navigation routing between pages. This experience taught me that prompting is most effective when broken into incremental, precise steps and that feeding error logs back into the system creates a much faster debugging loop than troubleshooting alone. These refinements ensured the final prototype was not only visually cohesive but also functionally reliable.
